

# TUFLOW

## Managing Multiple Events and Scenarios

---

---

---

---

---

---

---

---

# Multiple Events and Scenarios

- Run all your simulations from one .tcf file
  - Yes, it is possible!

---

---

---

---

---

---

---

---

# Events

- An "Event" is one or more boundaries that have a common source or probability (eg. same ARI)
- Any number of Events can be set up and defined
- Up to 9 different events (giving one overall event) can be specified per simulation

---

---

---

---

---

---

---

---

### Example of Combined Events

- Study area has two sources of water:
  - from the river
    - Different rainfall/runoff probabilities
    - Different duration storms
  - into or from the ocean
    - Different tidal or storm surge conditions
- TUFLOW simulation uses a combination of above

---

---

---

---

---

---

---

---

### Database of Events

- Create a database of possible events
- Events defined in a TUFLOW Event File (.tef)
  - Specify in .tcf file using "Event File == ....tef"
- Use "Define Event == ..." to start an event
- "End Define" to finish
- Any .tcf or .ecf command can be used within, or outside, a "Define Event" block
- Define Event can only be used in a .tef file

---

---

---

---

---

---

---

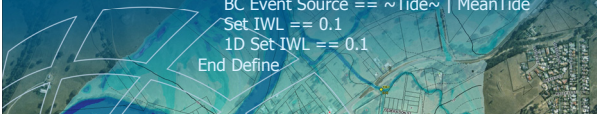

---

### Example of .tef File Event Definitions

```
Define Event == Q100 ! Q100 runoff
BC Event Source == ~ARI~ | Q100
Output Folder == ..\results_Q100\2d
1D Output Folder == ..\results_Q100\1d
End Define

Define Event == 06h
BC Event Source == ~Durn~ | 06h
End Time (h) == 9
Map Output Interval == 900
Time Series Output Interval == 300
End Define

Define Event == MT ! Mean Tide
BC Event Source == ~Tide~ | MeanTide
Set IWL == 0.1
1D Set IWL == 0.1
End Define
```

---

---

---

---

---

---

---

---

### Specifying Events

- Name of event(s) specified either by
  - Using "Model Events == <event1> | <event2> | ..." in .tcf file
  - Or using -e <event> option when running TUFLOW
  - e option(s) override "Model Events == " command
- Keys "~e1~", "~e2~", etc
  - Use keys in .tcf filename to control where event name is inserted
  - Keys are optional – if not included, event name is added to end of .tcf file

---

---

---

---

---

---

---

---

### Specifying Events Example

- Simulation to be carried out is for the Q100 storm, for a 6 hour duration, with a mean tide at the outlet
- The .tcf file is named "BR\_exg\_~e1~\_~e2~\_~e3~\_001.tcf"
- To run this simulation either
  - Specify "Model Events == Q100 | 06h | MT" in .tcf file and run TUFLOW
  - or use a .bat file line like  
TUFLOW.exe -e1 Q100 -e2 6h -e3 MT BR\_exg\_~e1~\_~e2~\_~e3~\_001.tcf
- Output files will be named "BR\_exg\_Q100\_06h\_MT\_001"

---

---

---

---

---

---

---

---

### USA – Use Short Acronyms!

- Q100 – 100 year ARI flow event
- Q020 – 20 year ARI flow event
- 03h – 3 hour duration storm
- QPMF – Probable Maximum Flood flows
- H050 – 50 year Storm Tide
- Q2011 – 2011 flows for 2011 flood calibration

---

---

---

---

---

---

---

---

## Managing Scenarios

- A scenario is essentially a configuration of TUFLOW inputs
- A scenario may be simulated multiple times using different combinations of events
- Any number of scenarios can be set up and defined
- Up to 9 different scenarios (giving one overall scenario) can be specified per simulation

10

## Examples of Scenarios

- Could be simply testing a different timestep
- Usually different topographic configurations
  - Existing situation
  - Proposed development options
  - 1974 topography

11

## USA – Use Short Acronyms!

- exg – Existing topography
- OpA – Development Option A
- st3 – Sensitivity Test 3
- c11 – 2011 topography for 2011 flood calibration

12

## Setting Up Scenarios

- You have to become a bit of a programmer!
- Defined by building logic into any TUFLOW control file
- Use "If Scenario == " constructs

```
If Scenario == OpA
  Read Grid Zpts == dem\DEM_OpA.asc
End If
```

13

## If Scenario Construct

- If Scenario == s1 | s2 | ...  
...  
{Else If Scenario == s3 | s4 | ...}  
...  
{Else}  
...  
End If
- Can nest If Scenarios within If Scenarios if you want!

14

## Specifying Scenarios

- Name of scenario(s) specified either by
  - Using "Model Scenarios == <s1> | <s2> | ..." in .tcf file
  - Or using -s <scenario> option when running TUFLOW
  - -s option(s) override "Model Scenarios == " command
- Keys "~s1~", "~s2~", etc
  - Use keys in .tcf filename to control where scenario name is inserted
  - Keys are optional – if not included, scenario name is added to end of .tcf file

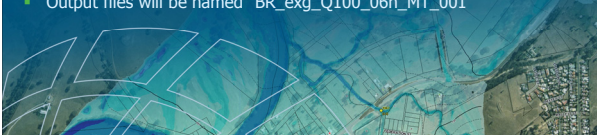

15

### Specifying Scenarios Example

- Simulation to be carried out is for the existing topography (Scenario "exg") for the Q100 6h storm with a mean tide at the outlet
- The .tcf file is named "BR\_~s1~\_~e1~\_~e2~\_~e3~\_001.tcf"
- To run this simulation either
  - Specify "Model Scenario == exg" and "Model Events == Q100 | 06h | MT" in .tcf file and run TUFLOW
  - or use a .bat file line like  
TUFLOW.exe -s1 exg -e1 Q100 -e2 6h -e3 MT BR\_~s1~\_~e1~\_~e2~\_~e3~\_001.tcf
- Output files will be named "BR\_exg\_Q100\_06h\_MT\_001"

16

---

---

---

---

---

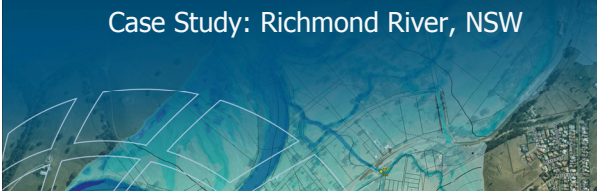

---

---

---

### Modular flood modelling using TUFLOW's new EVENT and SCENARIO management

#### Case Study: Richmond River, NSW

---

---

---

---

---

---

---

---

### Richmond River, NSW, Australia

- 6,900km<sup>2</sup> catchment
- 1,000km<sup>2</sup> floodplain
- 5 Local Councils
- Over 13 flood models built in 20 years for different areas
- Various software and various schemes (1d, quasi-2d, 1d/2d)
- Discrepancies with results along model boundaries

18

---

---

---

---

---

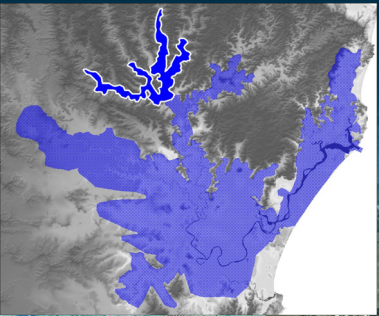

---

---

---

### Modular Modelling

- Ballina (10m, 20m, 40m)
- Newrybar (10, 20m)
- Mid Richmond (60m)
- Casino (20m, 60m)
- Lismore (5m, 20m, 60m)
- Wilsons River (20m)
- Leycester Creek (20m)

1.4 million 2d cells!

19

---

---

---

---

---

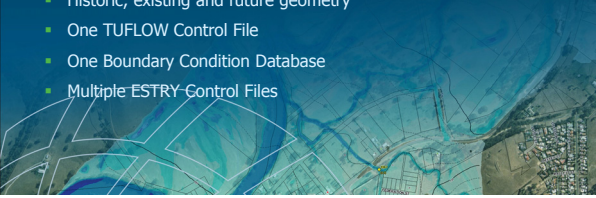

---

---

---

### How does it work?

- 7 models
- Can be run individually or in combination with other neighbouring models
- 5 historical events and design events
- Historic, existing and future geometry
- One TUFLOW Control File
- One Boundary Condition Database
- Multiple ESTRY-Control Files

20

---

---

---

---

---

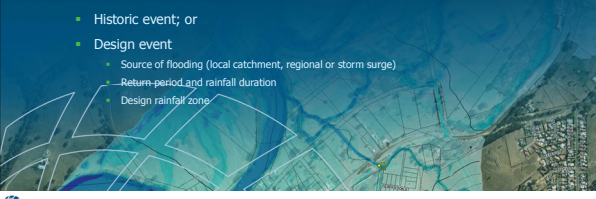

---

---

---

### Scenarios and Events

- Scenario 1 – CAL | EXG | INT
  - Calibration, existing or mitigated
- Scenarios 2 to 8 – BAL | NEW | MID | CAS | LIS | WIL | LEY
  - At least one of the 7 model areas
- Event 1
  - Historic event; or
  - Design event
    - Source of flooding (local catchment, regional or storm surge)
    - Return period and rainfall duration
    - Design rainfall zone

21

---

---

---

---

---

---

---

---

### TUFLOW Control File

```
Read Materials File == Richmond_002.tmf
BC Database == ..\bc_dbase\Richmond_bc_dbase_003.csv
Event File == Richmond_Events_002.tef
Read File == Richmond_2D_General_Commands_002.tcd

#####
### CASINO MODEL ###
#####

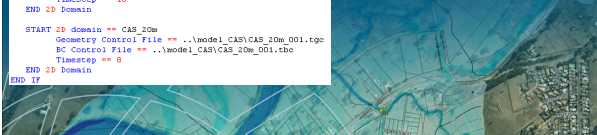

IF SCENARIO == CAS
  START 1D Domain
    ESTRY Control File == ..\model_CAS\CAS_001.ecf
  END 1D Domain

  START 2D domain == CAS_60m
    Geometry Control File == ..\model_CAS\CAS_60m_001.tgc
    BC Control File == ..\model_CAS\CAS_60m_001.tbc
    Timestep == 10
  END 2D Domain

  START 2D domain == CAS_20m
    Geometry Control File == ..\model_CAS\CAS_20m_001.tgc
    BC Control File == ..\model_CAS\CAS_20m_001.tbc
    Timestep == 8
  END 2D Domain
END IF
```

**Common commands:**

- Materials file
- BC Database
- Event management file
- Common read file

---

---

---

---

---

---

---

---

### Event Management File – part 1

- IF Scenario construct used to define event based on Existing (EXG) or Mitigated (INT) scenario
- Therefore, design event boundary conditions to be used
- Event definitions used within the single BC database

```
! Scenario == EXG | INT
Output Folder == \TUFLOW_Dealresults_deal2d
Write Check Files == \TUFLOW_Dealcheck_deal2d
Log Folder == \TUFLOW_Deallog_deal
ID Output Folder == \TUFLOW_Dealresults_deal2d
ID Write Check Files == \TUFLOW_Dealcheck_deal2d

Start Time == 0
Start Map Output == 30

Define Event == 100yr_A.s1
BC Event Source == -River_ABL- | 100yr
BC Event Source == -Rain_ABL- | 100yr
BC Event Source == -Ocean_ABL- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
End Time == 120
End Define

Define Event == 100yr_B.s1
BC Event Source == -River_ABL- | 100yr
BC Event Source == -Rain_ABL- | 100yr
BC Event Source == -Ocean_ABL- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
End Time == 70
End Define

Define Event == 100yr_C.s1
BC Event Source == -River_ABL- | 100yr
BC Event Source == -Rain_ABL- | 100yr
BC Event Source == -Ocean_ABL- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
BC Event Source == -Dwr- | 100yr
End Time == 70
End Define

File IF Scenario == CAL
```

25

TUFLOW

---

---

---

---

---

---

---

---

---

---

### Event Management File – part 2

- IF Scenario construct used to define Historic event (CAL) scenario
- Event definition used within the single BC database
- Start and End simulation times specified

```
File IF Scenario == CAL
Output Folder == \TUFLOW_Calresults_cal2d
Write Check Files == \TUFLOW_Calcheck_cal2d
Log Folder == \TUFLOW_Callog_cal
ID Output Folder == \TUFLOW_Calresults_cal2d
ID Write Check Files == \TUFLOW_Calcheck_cal2d

Define Event == 1974
BC Event Source == -Event- | 1974
Start Time == 0.4
End Time == 205
Start Map Output == 5.5
End Define

Define Event == 1976
BC Event Source == -Event- | 1976
Start Time == 3
End Time == 74
End Define

Define Event == 2005
BC Event Source == -Event- | 2005
Start Time == 03.5
End Time == 120
End Define

Define Event == 2008
BC Event Source == -Event- | 2008
Start Time == -5
End Time == 300
End Define

Define Event == 2009
BC Event Source == -Event- | 2009
Start Time == -5
End Time == 150
End Define

End IF
```

TUFLOW

---

---

---

---

---

---

---

---

---

---

### Geometry Control File

- Single geometry control file for each 2D domain
- IF Scenario construct used to adjust geometry based on historic, existing or mitigated catchment

```
! Scenario == EXG
Read GIS 2 Shape MIN == \2d_sah\2d_sah_LIS_5m_oth_sth_levee_remove_001.MIF
Else IF Scenario == INT
Read GIS 2 Line Thick == \2d_sah\2d_sah_LIS_5m_levee_001.MIF
End IF
```

27

TUFLOW

---

---

---

---

---

---

---

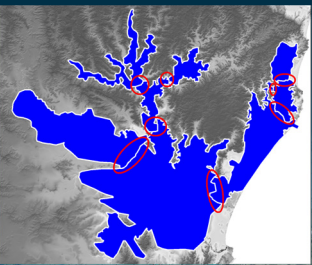

---

---

---

### Boundary Condition Control File

- Single boundary condition control file for each 2D domain
- If Scenario construct used to adjust boundary conditions based on historic, existing or mitigated catchment
- If Scenario construct used to assign 2d2d boundaries for adjoining models

```
IF SCENARIO == NTH
  READ GIS BC == ..\model1_linking\2d2d\2d_2d_BAL_10m_NTH_10m_001.MIF
  READ GIS BC == ..\model1_linking\2d2d\2d_2d_BAL_10m_NTH_10m_001.MIF
END IF

IF SCENARIO == MID
  READ GIS BC == ..\model1_linking\2d2d\2d_2d_MID_60m_001.MIF
END IF
```

28

---

---

---

---

---

---

---

---

### Batch files and output

Start TUFLOW in batch mode

TCF = Richmond.~e1~.~s1~.005.tcf

```
start TUFLOW isp w32.exe -b -e1 2009 -s1 CAL -s2 CAS -s3 LIS -s4 MID Richmond -e1~ -s1~ 005.tcf
```

Event 1 = 2009 (historic rainfall)

Scenario 1 = CAL (calibration)

Scenario 2 = CAS

Scenario 3 = LIS

Scenario 4 = MID (models)

Mandatory scenarios

Optional scenarios

Richmond(2009)CAL005\_CAS+LIS+MID.tlf
